Onboard systems
OSHA 1926.1153 TABLE 1 REQUIREMENTS

These systems fall under OSHA 1926.1153 table 1, section vii: handheld and stand-mounted drills (including impact and rotary hammer drills). In order to be OSHA 1926.1153 table 1 compliant, the below requirements must be met:

- Use drill equipped with commercially available shroud or cowling with dust collection system
- Operate and maintain tool in accordance with manufacturer’s instructions to minimize dust emissions
- Dust collector must provide the air flow recommended by the tool manufacturer, or greater
- Have a filter with 99% or greater efficiency and a filter-cleaning mechanism

Note: Vacuum must be equipped with a HEPA-filter when cleaning holes

OSHA 1926.1153 Table 1 states that no respirator is required if the above controls are fully and properly implemented.

<table>

**Can be upgraded to OSHA 1926.1153 table 1 compliance through purchase of the compliant filter box.
SYSTEM OVERVIEW

Self-contained dust-collection systems are systems that fit on the tool and do not require a separate stand-alone vacuum to collect dust. Hilti currently offers the below systems with this configuration:

<table>
<thead>
<tr>
<th>Tool</th>
<th>Accessory</th>
<th>Vacuum</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rotary hammer TE 4-A 18 or TE 4-A 22</td>
<td>Dust removal system TE DRS 4-A</td>
<td></td>
</tr>
<tr>
<td>Rotary hammer TE 6-A 36</td>
<td>Dust removal system TE DRS 6-A</td>
<td></td>
</tr>
<tr>
<td>Rotary hammer TE 7 or TE 7-C</td>
<td>Dust removal system TE DRS-M</td>
<td></td>
</tr>
</tbody>
</table>

Note: previous generations of tools may have different item numbers or nomenclature. Check with your local Hilti representative or product instruction manual to verify.
Hilti TE 4-A/6-A with on-board dust removal system (DRS)

Hilti has performed testing of the above system to determine the operator’s respirable silica dust exposure in accordance with EN 50632-1 and EN 50632-2-6. Testing was performed under the following conditions:

- Room size: 7.8m x 7.8m x 3.3m Closed — no air exchange
- Drilled hole dimensions: ø5/8” x 2”
- Test duration: 1 hour
- Total holes drilled: 75
- Drilling orientation: overhead
- Base material: concrete
- Sampler: 10 l/min GSP pump, FSP sampler, ISO 7708-compliant, 5 μm filter
- Air sample volume collected during test: 600 liters
- Dust collection receptacle on tool emptied every 8 holes drilled

DRS module items 2098490 (TE 4A gen 2) and 2172902 (TE 6A gen 4) only

Results:

<table>
<thead>
<tr>
<th>Time-Weighted Average Respirable Silica Dust Exposure*1,2</th>
<th>45 μg/m³</th>
</tr>
</thead>
</table>

1 Exception: EN 50632-2-6 specifies drilling one hundred twenty ø16mm x 50mm holes at a 15° downward-from-horizontal position.
2 The silica content of base materials varies. As a result, the silica content in respirable dust samples also varies. The above-published exposure value is based on a 20% silica content applied to the total respirable dust measurement.
3 Measured average silica content during testing was 13.8%.
4 These test results can be applied for modules used with previous generations of tools.
Cordless rotary hammer

TE DRS OSHA

Hilti developed TE DRS dust collection system with a filter cleaning mechanism and 99% filter efficiency, compliant with OSHA 1926.1153 Table 1. The TE DRS-4-A dust box is compatible with the TE DRS-4-A and TE DRS-4-A (T1) only. The TE DRS-6-A dust box is compatible with the TE DRS-6-A and TE DRS-6-A (T1) only.

Set-up

1. Empty the TE DRS dust box, and clean and inspect the filter.
2. Attach the TE DRS module to the rotary hammer.
3. Start TE DRS vacuum by pressing tool’s control switch.
4. Verify proper operation of the TE DRS vacuum, including suction at the extraction head.
   • Check for damage or leaks in the dust box, hose, and extraction head.
   • Make sure the hose extends/retracts freely.

Drilling

1. Start drilling, and allow the TE DRS to reach full speed before beginning to drill.
   • Hold the rotary hammer perpendicular to the work surface and keep the extraction head in contact with the work surface.
2. To maximize dust collection, after the hole is drilled, slowly withdraw bit from the hole, and keep the rotary hammer running until the bit is fully withdrawn.

Cleaning and maintenance

• Empty the dust box after every 5 in³ of hole drilling (e.g. after 8-10 holes 5/8 in x 2 in (16 mm x 50 mm)).
• After every 3 in³ of hole drilling (e.g. after 5 holes ø ½ in depth 3 in (ø12 mm x 76 mm)) or if suction performance decreases push the button of the cleaning mechanism 5 times in each direction.
• To minimize dust emission, either use a vacuum to clean the dust box or place the dust box in a plastic bag keeping it closed as much as possible.
• Replace the filter if the dust debris cannot be removed, or if there are any tears or leaks in the filter.
• If more-than-usual dust is emitted during drilling, inspect the TE DRS system, and clean/inspect the dust box and filter.

\(^1\)The correct depth gauge will depend on your model of tool. For questions, check your instruction manual or call Hilti at 800-879-8000.

*The correct depth gauge will depend on your model of tool. For questions, check your instruction manual or call Hilti at 800-879-8000.

1 If a decrease in suction occurs with the VC 75-1-A22, Hilti’s manufacturer guidelines recommends pushing the filter cleaning button on the tool to clear the filter.
SYSTEM OVERVIEW

Hilti rotary hammers with a DRS-S are OSHA 1926.1153 table 1 compliant through use of a dust collection shroud hooked up to a vacuum that meets OSHA 1926.1153 table 1 requirements. This shroud attaches to the depth gauge on the tool, and must be purchased separately for tools with an SDS-max connection. Any Hilti rotary hammer with a depth gauge will be OSHA 1926.1153 table 1 compliant with the DRS-S if a Hilti vacuum is used. Hilti currently offers the below systems with this configuration:

<table>

DRILLING — ROTARY HAMMER DRILLS AND COMBI-HAMMERS

TE Dust Control — OSHA

Hilti developed drilling dust collection systems with a shroud, to be attached to a Hilti vacuum with a filter cleaning mechanism and 99% filter efficiency, compliant with OSHA 1926.1153, Table 1.

Set-up

1. Attach the appropriate dust collection shroud to the drill.
2. Insert the bit. Rotate the bit in the chuck until you hear a clicking noise to verify that the bit is firmly inserted into the chuck.
3. Choose the correct collector based on the system and insert being used.
4. Set the proper depth using the depth gauge mechanism on the shroud. This will either be a depth gauge rod (DRS-Y, hollow drill bits) or a set of tabbed stops (DRS 4-A/6-A/M, DRS-S)
5. Verify that the bit is flush or below the surface of the dust collection device. Note that for the DRS-Y, with 24” bits, the bit will extend approximately 1” beyond the shroud.
6. Make sure that drilling shroud extends and retracts freely.
7. Start vacuum.
8. Verify proper operation of the dust collection system, including suction at the extraction head.
   • Check for damage or leaks in the vacuum, hose, and extraction head.
   • See instructions for vacuum.

Drilling

1. Start the vacuum before beginning to drill.
   • Hold the drill perpendicular to the work surface and keep the extraction head in contact with the work surface.
2. To maximize dust collection, after the hole is drilled, slowly withdraw bit from the hole, and keep the drill running until the bit is fully withdrawn.

Cleaning and maintenance

• See instructions for vacuum.

SYSTEM OVERVIEW

Hilti rotary hammers with a DRS-D are OSHA 1926.1153 Table 1 compliant through use of a dust collection shroud hooked up to a vacuum that meets OSHA 1926.1153 Table 1 requirements. This shroud attaches to the vacuum and suctions itself to the drilling surface, the drill is then placed in the center of the DRS-D opening to start drilling.

Hilti currently offers the below systems with this configuration:

<table>
<thead>
<tr>
<th>Tool</th>
<th>Accessory</th>
<th>Vacuum (use any)</th>
</tr>
</thead>
<tbody>
<tr>
<td>TE 3-C</td>
<td>DRS-C</td>
<td>VC 75-1-A221</td>
</tr>
<tr>
<td>TE 7 and TE 7-C</td>
<td>TE 4-A 22</td>
<td>VC 125-6</td>
</tr>
<tr>
<td>TE 6-A 36</td>
<td>DRS-C</td>
<td>VC 125-9</td>
</tr>
<tr>
<td>TE 7-A</td>
<td>VC 20-U</td>
<td>VC 40-U</td>
</tr>
<tr>

</tr>
</tbody>
</table>

Note: previous generations of tools may have different item numbers or nomenclature. Check with your local Hilti representative or product instruction manual to verify.

1 If a decrease in suction occurs with the VC 75-1-A22, Hilti’s manufacturer guidelines recommends pushing the filter cleaning button on the tool to clear the filter.
**TE Dust Control — OSHA**

Hilti developed drilling dust collection systems with a shroud, to be attached to a Hilti vacuum with a filter cleaning mechanism and 99% filter efficiency, compliant with OSHA 1926.1153, Table 1.

**Set-up**

1. Attach the appropriate dust collection shroud to the drill.
2. Insert the bit. Rotate the bit in the chuck until you hear a clicking noise to verify that the bit is firmly inserted into the chuck.
3. Choose the correct collector based on the system and insert being used.
4. Set the proper depth using the depth gauge mechanism on the shroud. This will either be a depth gauge rod (DRS-C, hollow drill bits) or a set of tabbed stops (DRS 4-A/6-A/M, DRS-S). A depth gauge is not needed on the DRS-C when using the attachments for chiseling.
5. Verify that the bit is flush or below the surface of the dust collection device. Note that for the DRS-C, with 24” bits, the bit will extend approximately 1” beyond the shroud. When chiseling with the DRS-C, the chisel will extend beyond the head of the chiseling shroud to allow the insert to chisel.
6. When drilling, make sure that drilling shroud extends and retracts freely.
7. Start vacuum.
8. Verify proper operation of the dust collection system, including suction at the extraction head
   - Check for damage or leaks in the vacuum, hose, and extraction head.
   - See instructions for vacuum.

**Drilling**

1. Start to drill.
   - Hold the drill perpendicular to the work surface and keep the bit in contact with the work surface inside the DRS-D.
2. To maximize dust collection, after the hole is drilled, slowly withdraw bit from the hole, and keep the drill running until the bit is fully withdrawn.

**Cleaning and maintenance**

- See instructions for vacuum.

OSHA 1926.1153 TABLE 1 REQUIREMENTS

These systems fall under OSHA 1926.1153 table 1, section x: jackhammers and handheld powered chipping tools and section vii: handheld and stand-mounted drills (including impact and rotary hammer drills). In order to be OSHA 1926.1153 table 1 compliant, the below requirements must be met:

Options for chiseling applications

- Use tool with water delivery system that supplies a continuous stream or spray of water at the point of impact

OR

Options for drilling or chiseling applications

- Use tool equipped with commercially available shroud or cowling with dust collection system
- Operate and maintain tool in accordance with manufacturer's instructions to minimize dust emissions
- Dust collector must provide the air flow recommended by the tool manufacturer, or greater
- Have a filter with 99% or greater efficiency and a filter-cleaning mechanism

Note: Vacuum must be equipped with a HEPA-filter when cleaning holes

OSHA 1926.1153 Table 1 requires a respirator to be worn in certain environments based on the time of the application. Check below to see when an APF 10 respirator must be worn.

OR

Use tool equipped with commercially available shroud and dust collection system. Operate and maintain tool in accordance with manufacturer’s instructions to minimize dust emissions. Dust collector must provide the air flow recommended by the tool manufacturer, or greater, and have a filter with 99% or greater efficiency and a filter-cleaning mechanism.

|                                                                  | ≤ 4 hours / shift | > 4 hours / shift |
|                                                                  | None             | APF 10            |
|                                                                  | APF 10           | APF 10            |
Check below to see how your system can be compliant with OSHA 1926.1153 Table 1. To verify the generation of your tool, check the rating plate, or call Hilti at 800-879-8000 with your serial number. To check fit of the DRS-Y with older tool generations, check the sticker on the inside of the case on the DRS-Y, or refer to the instruction manual.

### SYSTEM OVERVIEW

Hilti SDS-max rotary hammers are OSHA 1926.1153 table 1 compliant for both drilling and chiseling applications through use of a dust collection shroud hooked up to a vacuum that meets OSHA 1926.1153 table 1 requirements. Hilti currently offers the below systems with this configuration:

Note: previous generations of tools may have different item numbers or nomenclature. Check with your local Hilti representative or product instruction manual to verify.

1. If a decrease in suction occurs with the VC 75-1-A22, Hilti’s manufacturer guidelines recommends pushing the filter cleaning button on the tool to clear the filter.
TE Dust Control — OSHA

Hilti developed drilling dust collection systems with a shroud, to be attached to a Hilti vacuum with a filter cleaning mechanism and 99% filter efficiency, compliant with OSHA 1926.1153, Table 1.

Set-up

1. Attach the appropriate dust collection shroud to the drill.
2. Insert the bit. Rotate the bit in the chuck until you hear a clicking noise to verify that the bit is firmly inserted into the chuck.
3. Choose the correct collector based on the system and insert being used.
4. Set the proper depth using the depth gauge mechanism on the shroud. This will either be a depth gauge rod (DRS-Y, hollow drill bits) or a set of tabbed stops (DRS 4-A/6-A/M, DRS-S). A depth gauge is not needed on the DRS-Y when using the attachments for chiseling.
5. Verify that the bit is flush or below the surface of the dust collection device. Note that for the DRS-Y, with 24” bits, the bit will extend approximately 1” beyond the shroud. When chiseling with the DRS-Y, the chisel will extend beyond the head of the chiseling shroud to allow the insert to chisel.
6. When drilling, make sure that drilling shroud extends and retracts freely.
7. Start vacuum.
8. Verify proper operation of the dust collection system, including suction at the extraction head
   - Check for damage or leaks in the vacuum, hose, and extraction head.
   - See instructions for vacuum.

Drilling

1. Start the vacuum before beginning to drill.
   - Hold the drill perpendicular to the work surface and keep the extraction head in contact with the work surface.
2. To maximize dust collection, after the hole is drilled, slowly withdraw bit from the hole, and keep the drill running until the bit is fully withdrawn.

Cleaning and maintenance

- See instructions for vacuum.
Section vii: Handheld and stand-mounted drills (including impact and rotary hammer drills)

Current Hilti rotary hammers that use a DRS-D shroud:
- TE 2 (and 2-S)
- TE 3-C
- TE 7
- TE 4-A 22
- TE 6-A 36
- TE 7-C
- TE 30 (and 30-C)
- TE 30-A36
- TE 40-AVR
- TE 50-AVR
- TE 60-A36
- TE 60-AVR
- TE 60-ATC/AVR
- TE 70-AVR
- TE 70-ATC/AVR
- TE 80-ATC/AVR

For instructions on how to assemble these systems, please refer to the Hilti North America Youtube page.
OSHA 1926.1153 TABLE 1 REQUIREMENTS

These systems fall under OSHA 1926.1153 Table 1, section vii: handheld and stand-mounted drills (including impact and rotary hammer drills). In order to be OSHA 1926.1153 Table 1 compliant, the below requirements must be met:

- Use drill equipped with commercially available shroud or cowling with dust collection system
- Operate and maintain tool in accordance with manufacturer’s instructions to minimize dust emissions
- Dust collector must provide the air flow recommended by the tool manufacturer, or greater
- Have a filter with 99% or greater efficiency and a filter-cleaning mechanism

Note: Vacuum must be equipped with a HEPA-filter when cleaning holes

Table 1 states that no respirator is required if the above controls are fully and properly implemented.

<table>

1 If a decrease in suction occurs with the VC 75-1-A22, Hilti’s manufacturer guidelines recommends pushing the filter cleaning button on the tool to clear the filter.

2 When used with the DRS-D with an SDS-Max tool, the VC 75 can be used for dust collection when drilling diameters up to 32 mm when used on wall and floor applications.
**SYSTEM OVERVIEW**

Hilti rotary hammers with a DRS-D are OSHA 1926.1153 Table 1 compliant through use of a dust collection shroud hooked up to a vacuum that meets OSHA 1926.1153 Table 1 requirements. This shroud attaches to the vacuum and suctions itself to the drilling surface, the drill is then placed in the center of the DRS-D opening to start drilling.

Hilti currently offers the below systems with this configuration:

2. When used with the DRS-D with an SDS-Max tool, the VC 75 can be used for dust collection when drilling diameters up to 32 mm when used on wall and floor applications.
DRILLING — ROTARY HAMMER DRILLS AND COMBI-HAMMERS

TE Dust Control — OSHA

Hilti developed drilling dust collection systems with a shroud, to be attached to a Hilti vacuum with a filter cleaning mechanism and 99% filter efficiency, compliant with OSHA 1926.1153, Table 1.

Set-up

1. Attach the DRS-D to the vacuum.
2. Insert the bit. Rotate the bit in the chuck until you hear a clicking noise to verify that the bit is firmly inserted into the chuck.
3. Turn on the vacuum, making sure automatic filter cleaning is turned off.
4. Place DRS-D onto drilling surface.
5. Verify that the DRS-D is flush to the wall and has sealed itself in place.
6. Verify proper operation of the dust collection system.
   • Check for damage or leaks in the vacuum, hose, and extraction head.
   • See instructions for vacuum.
   • See instructions for vacuum.

Drilling

1. Start to drill.
   • Hold the drill perpendicular to the work surface and keep the bit in contact with the work surface inside the DRS-D.
2. To maximize dust collection, after the hole is drilled, slowly withdraw bit from the hole, and keep the drill running until the bit is fully withdrawn.

Cleaning and maintenance

• See instructions for vacuum.

* OSHA 1926.1153 Table 1 does not address handheld core drills being used wet. For this reason, the only way to comply with handheld dry core drilling is to utilize objective data or exposure assessment procedures.

** Hilti interprets dust control coring systems as being in OSHA 1926.1153 table 1, section vii “handheld and stand mounted drills (including impact and rotary hammers)”
CORING — WET

DIA Dust Control — OSHA

Hilti developed diamond coring systems are equipped with a water connection which is to be attached to a pressurized water source. When rig-mounted, these systems are compliant with OSHA 1926.1153, Table 1.

Set-up

1. If required, attach the drill stand to the drilling surface using the appropriate anchoring accessories.
2. Attach the water source to the tool.
3. Insert the bit and ensure its tightened by turning the chuck to the closed position.
4. Turn on the water.
5. Verify you have the appropriate amount of water for the application. Verify the water delivery system operates properly with no leaks, delivering water freely inside the bit.
   - See instructions for core machines.

Drilling

1. Start the water before beginning to drill.
2. Begin drilling, applying the required amount of pressure.
3. Adjust water flow rate to minimize visible dust.

Cleaning and maintenance

- See instructions for core rigs.

Clean-up of slurry before it dries can help minimize secondary exposure. Ensure that cleanup and disposal of concrete slurry is done in accordance with relevant state/local regulations.
CORING — DRY CORING

DIA Dust Control — OSHA

Hilti developed dry diamond core drills and bits to be attached to a Hilti vacuum with a filter cleaning mechanism and 99% filter efficiency. Hilti considers these coring applications to fit in, and be in compliance with, OSHA 1926.1153, Table 1, (vii) handheld and stand-mounted drills (including impact and rotary hammer drills).

Set-up

1. If using as rig-mounted, attach the drill stand to the drilling surface using the appropriate anchoring accessories.
2. Attach the vacuum hose to the drill's vacuum hose connector.
3. Insert the bit and ensure its tightened by turning the chuck to the closed position.
4. Start vacuum.
5. Verify proper operation of the dust collection system, including suction at the end of the bit.
   • Check for damage or leaks in the vacuum, hose, and hose connector.
   • See instructions for vacuum.

Drilling

1. Start the vacuum before beginning to drill.
2. Begin drilling, applying the required amount of pressure.
3. To maximize dust collection, after the hole is drilled, slowly withdraw bit from the hole, and keep the drill and vacuum running until the bit is fully withdrawn.

Cleaning and maintenance

• See instructions for vacuum.

OSHA 1926.1153 TABLE 1 REQUIREMENTS

These systems fall under OSHA 1926.1153 Table 1, section x: jackhammers and handheld powered chipping tools. In order to be OSHA 1926.1153 Table 1 compliant, the below requirements must be met:

- Use tool with water delivery system that supplies a continuous stream or spray of water at the point of impact
- Use tool equipped with commercially available shroud or cowling with dust collection system
- Operate and maintain tool in accordance with manufacturer’s instructions to minimize dust emissions
- Dust collector must provide the air flow recommended by the tool manufacturer, or greater
- Have a filter with 99% or greater efficiency and a filter-cleaning mechanism

OSHA 1926.1153 Table 1 requires a respirator to be worn in certain environments based on the time of the application. Check below to see when an APF 10 respirator must be worn.

SYSTEM OVERVIEW

Hilti concrete cutting tools are OSHA 1926.1153 table 1 compliant for both mortar removal and non-mortar removal applications through use of a dust collection shroud hooked up to a vacuum that meets OSHA 1926.1153 table 1 requirements. Hilti currently offers the below systems with this configuration. The handheld DCH 300-X electric saw complies with OSHA 1926.1153 Table 1 through both a dust collection shroud connected to a vacuum or a integrated water delivery system to supply water to the cutting surface.

OSHA 29 CFR §1926.1153
Respirable Silica Dust Exposure

Objective Test Data

**Hilti DCH 230-300, depth gauge, VC 20-U/40-U/40-UE vacuum**

Hilti has performed testing of the above system to determine the operator's respirable silica dust exposure in accordance with EN 50632-1 and EN 50632-2-22. Testing was performed under the following conditions:

- Room size: 7.8m x 7.8m x 3.3m (200 m³). Closed – no air exchange.
- Cutting disc: EOD SPX.
- Test duration: 1 hour.
- Cutting depth: 40 mm.
- Cutting length: 45 feet.
- Cutting orientation: horizontal down, approx. 3 ft above floor level.
- Force applied: average 70-90% of tool rated amperage.
- Base material: concrete.
- Sampler: 10 l/min GSP pump, FSP sampler. ISO 7708-compliant. 5 µm filter.
- Air sample volume collected during test: 600 liters.

**Results:**

<table>
<thead>
<tr>
<th>Time-Weighted Average Respirable Silica Dust Exposure(^1,2)</th>
<th>327 µg/m(^3)</th>
</tr>
</thead>
</table>

The 8-hour TWA is 41 µg/m\(^3\) if working one hour @ 327 µg/m\(^3\) (1-hour TWA), and no further exposure occurs throughout the shift.

---

\(^1\) The silica content of base materials varies. As a result, the silica content in respirable dust samples also varies. The above-published exposure value is based on a 20% silica content applied to the total respirable dust measurement. Measured average silica content during testing was 15.5%.

\(^2\) Exposure value represents the time-weighted average (TWA) over the 1-hour test period. Due to the test being conducted in a closed, non-ventilated room, this TWA exposure value would increase if the test duration was extended under the same conditions.
29 CFR §1926.1153(d)(2)(ii)

Performance Option

How to utilize Hilti “Objective Data”

Hilti has conducted testing to establish the respirable silica dust exposure (“exposure level”), associated with the use of various Hilti tool systems. These tests were performed in accordance with EN 50632, except the specific work configuration may vary to provide more versatile data and better address U.S. practices. The purpose of the testing was to generate “Objective Data” to be used as part of the exposure assessment requirements of 29 CFR §1926.1153(d)(2)(ii).

Per the EN standard, testing was performed for 1 hour in a 200m³ closed, non-ventilated room. Under these conditions, exposure levels increase over time. The exposure values published in Hilti’s Objective Data represent the average over the 1-hour test period (1-hour TWA)\(^1\). Meaning the TWA started at zero, rose to the published 1-hour value, and would continue to rise if the test were continued.

Several underlying concepts important to applying the Objective Data to any case-specific assessment:

1. More/less work performed in a given time period will increase/decrease the exposure level.
2. Larger/smaller room size will decrease/increase the exposure level.
3. Air exchange decreases exposure levels. Specifically, a 100% air-exchange every hour (either by the work moving to a discrete area, or via sufficient air movement), means Hilti’s published 1-hour TWA exposure level is expected to conservatively represent a steady-state TWA. The conceptual basis is two-fold: air exchange would inherently reduce the published “closed room” exposure value. And sufficient air exchange to “reset” the environment every hour would keep the exposure values at that level. For reference, a typical 20”, 2500 CFM box fan would introduce 100% new air volume in Hilti’s test chamber (7,200 ft\(^3\)), every 3 minutes\(^2\).
4. The OSHA 50 µg/m\(^3\) Permissible Exposure Level (PEL), is based on an 8-hour TWA. This means the exposure level as an 8-hour TWA is ≤50 µg/m\(^3\); a 4-hour TWA is ≤100 µg/m\(^3\) (assuming no exposure for the remainder of the shift); a 2-hour TWA is ≤200 µg/m\(^3\) (assuming no exposure for the remainder of the shift) etc. (time [hours] x exposure level [µg/m\(^3\)] ≤ 400).

Hilti’s published Objective Data states the amount of work performed during the 1-hour test (“1-hour work”). Therefore, the respirable silica dust exposure level in any case-specific situation is expected to be below the 8-hour TWA PEL in the following conditions\(^3\):

- An employee performing ≤ “1-hour work” during a shift.
- An employee performing ≤ “1-hour work” in an hour, then moving to another discrete area and performing ≤ “1-hour work” in an hour, etc., throughout an entire shift.
- An employee performing ≤ “1-hour work” each hour, in an environment with sufficient air-exchange to prevent accumulation of airborne dust.

---

\(^1\) Hilti’s published Objective Data incorporates a silica content of 20% of the total respirable dust measurement. Site-specific silica content varies. OSHA Docket No. OSHA-2010-0034, reviewed 588 respirable dust samples from construction tasks, finding the silica content varied from <1%-50%, with an average of 9.1%.

\(^2\) Note introduction/exhaust of 100% air volume does not necessarily correlate to a 100% air exchange.

\(^3\) As long as: (1) Hilti’s published Objective Data exposure level is ≤50 µg/m\(^3\); (2) work is performed in a room with volume ≥ 200m\(^3\), and/or having adequate ventilation; and (3) site-specific respirable silica content is ≤20% of total respirable dust.
DCH 300/230

Presentation

Hilti developed DCH 300(X)/230 tool which could be connected to a vacuum cleaner to collect dust (which Hilti interprets to be compliant with OSHA 1926.1153, table 1 “hand-held grinder using a vacuum cleaner with at least 25 cfm per inch of the wheel diameter and a filter cleaning mechanism with an efficiency of 99% or greater)

Set-up

1. When cutting mineral materials, use a suitable vacuum cleaner (eg. Hilti VC 300) with the corresponding filter
2. Attach the depth gauge (DCH 300(X) = #212131/DCH 230 = #212187) to DCH tools with the desired depth of cut. Always keep the depth gauge in full contact with the base material when cutting
3. Connect vacuum cleaner hose to respective opening in DCH 300(X)/DCH 230 blade guard
4. Connect the tool to a suitable electric power source
5. Adjust the depth/ cut in steps of max. 40-50mm
6. Switch vacuum cleaner on first then switch DCH 300(X)/DCH 230 on and start cutting
7. Start cut by placing front of tool on base material, and then pivoting back of tool into the cut. Always keep front of tool in contact with base material.
8. Verify proper operation => Check for damage or leakage at tool, hose to connection of both. Ensure tool disc guard and exhaust port are free of obstruction.
9. When cut is finished, release trigger of DCH and allow to stop before removing from cut
10. Keep vacuum running until cutting is completed
11. The following will increase dust exposure — minimize these activities:
   • through cutting
   • cutting past the end of the base material
   • making multiple passes for a cut
   • pulling the DCH toward you to cut
   • attempting to angle the disc at other than a perpendicular cut into the base material

Application

• Electric powered cutter for the construction industry
• Design to for cutting mineral material with Diamond blades without use of water
• With synthetic resin-bonded fibre-reinforced abrasive disc discs the tools could be also used to cut metal (not connected to vacuum cleaner)
HILTI ANGLE GRINDERS WITH A CONCRETE CUTTING HOOD

Presentation

Hilti developed various angle grinders for mortar removal and other cutting applications. When configured with the correct guard/hood and connected to the appropriate vacuum, these tools are compliant with OSHA 1926.1153 Table 1 (xi) “handheld grinders for mortar removal (i.e., tuckpointing)” or (xii) ”handheld grinders for uses other than mortar removal” (note Hilti interprets the DCH 230/300(X) to be a “handheld grinder”). For OSHA 1926.1153 Table 1 compliance, the vacuum cleaner must have at least 25 cfm per inch of the wheel diameter, a filter cleaning mechanism, and a filter efficiency of at least 99%.

Set-up

1. When cutting mineral materials, use a suitable vacuum cleaner (eg. Hilti VC 300(X)) with the corresponding filter
2. Attach the guard/hood/depth gauge (see submittal package for appropriate item number) to the tool with the desired depth of cut. Always keep the depth gauge in full contact with the base material when cutting
3. Connect vacuum cleaner hose to respective opening in grinder blade guard
4. Connect the tool to a suitable electric power source
5. Adjust the depth/ cut in steps of max. 40-50mm
6. Switch vacuum cleaner on first then switch grinder on and start cutting
7. If setup properly, the blade will rotate toward the vacuum collection port. The end of the guard with the vacuum port must always be placed against the concrete first. Always pull or push the tool in the direction of the vacuum port.
8. Verify proper operation => Check for damage or leakage at tool, hose to connection of both. Ensure tool disc guard and exhaust port are free of obstruction.
9. When cut is finished, release trigger of tool and allow to stop before removing from cut
10. Keep vacuum running until cutting is completed
11. The following will increase dust exposure — minimize these activities:
    • through cutting
    • cutting past the end of the base material
    • making multiple passes for a cut
    • pulling/pushing the tool in a direction opposite the vacuum port
    • attempting to angle the disc at other than a perpendicular cut into the base material

Application

• Electric powered angle grinders/cutters for the construction industry
• Design to for cutting mineral material with Diamond blades without use of water
• With synthetic resin-bonded fibre-reinforced abrasive disc discs the tools could be also used to cut metal (not connected to vacuum cleaner)
Section ii: handheld power saws (any blade diameter)

Current Hilti saws with wet cutting solutions:

DSH Handheld Gas Saw Dust Control — OSHA

Hilti developed gas saw cutting systems which are equipped with a water connection to be attached to a pressurized water source, compliant with OSHA 1926.1153, Table 1. The use of the Hilti DSH-P eliminates the need for a pressurized water source.

Set-up

1. Attach the water source to the tool.
2. Turn on the water.
3. Verify that the user has the appropriate supply of water, and that the gas saw’s water valve functions properly.
4. See DSH gas saw operator’s instructions for additional information
   - Check for damage or leaks in the DSH gas saw’s valve and water tube.
   - Verify the spray nozzles are not clogged, and direct the water to the cutting surface.

Cutting

1. Turn on the pressurized water source before beginning to cut.
   - Adjust the water valve to ensure proper water flow during cutting to minimize visible dust.
2. Maintain water flow until cutting is completed.

Cleaning and maintenance

- See manufacturer’s instructions for wet cutting machines
Sections xii: Handheld grinders for uses other than mortar removal

OSHA 1926.1153 TABLE 1 REQUIREMENTS

These systems fall under OSHA 1926.1153 table 1, section xii: handheld grinders for use other than mortar removal. In order to be OSHA 1926.1153 table 1 compliant, the below requirements must be met:

- When performing outdoor applications only: use a grinder equipped with integrated water delivery system that continuously feeds water to the grinding surface

or

- Use tool equipped with commercially available shroud or cowling with dust collection system
- Operate and maintain tool in accordance with manufacturer’s instructions to minimize dust emissions
- Dust collector must provide the air flow recommended by the tool manufacturer, or greater
- Have a filter with 99% or greater efficiency and a filter-cleaning mechanism
- Dust collector must provide 25 cubic feet per minute (cfm) or greater of airflow per inch of wheel diameter

OSHA 1926.1153 Table 1 requires a respirator to be worn in certain environments based on the time of the application. Check below to see when an APF 10 respirator must be worn.

<table>
<thead>
<tr>

*Exposure assessment required

**See Hilti’s published Objective Data — if not applicable to a specific application, exposure assessment is required.

*** OSHA 1926.1153 Table 1 compliant, with the option to use objective data test report
Hilti has performed testing of the above system to determine the operator’s respirable silica dust exposure in accordance with EN 50632-1 and EN 50632-2-3. Testing was performed under the following conditions:

- Room size: 7.8m x 7.8m x 3.3m (200 m³). Closed – no air exchange.
- Grinding disc: DG-CW 150/6° CR-SP
- Test duration: 1 hour.
- Weight of collected dust: 1590 g.
- Grinding orientation: 15° from vertical.
- Grinding height: 2'-6' above floor-level.
- Force applied: average 70-90% of tool rated amperage.
- Base material: concrete slab.
- Sampler: 10 l/min GSP pump, FSP sampler. ISO 7708-compliant. 5 µm filter.
- Air sample volume collected during test: 600 liters.

Results:

<table>
<thead>
<tr>
<th>Time-Weighted Average Respirable Silica Dust Exposure¹,²</th>
<th>43 µg/m³</th>
</tr>
</thead>
</table>

¹ The silica content of base materials varies. As a result, the silica content in respirable dust samples also varies. The above-published exposure value is based on a 20% silica content applied to the total respirable dust measurement. Measured average silica content during testing was 10.0%.

² Exposure value represents the time-weighted average (TWA) over the 1-hour test period. Due to the test being conducted in a closed, non-ventilated room, this TWA exposure value would increase if the test duration was extended under the same conditions.
HOW TO UTILIZE HILTI “OBJECTIVE DATA”

29 CFR §1926.1153(d)(2)(ii)

Performance option

Hilti has conducted testing to establish the respirable silica dust exposure (exposure level), associated with the use of various Hilti tool systems. These tests were performed in accordance with EN 50632, except the specific work configuration may vary to provide more versatile data and better address U.S. practices. The purpose of the testing was to generate “Objective Data” to be used as part of the exposure assessment requirements of 29 CFR §1926.1153(d)(2)(ii).

Per the EN standard, testing was performed for 1 hour in a 200m$^3$ closed, non-ventilated room. Under these conditions, exposure levels increase over time. The exposure values published in Hilti’s Objective Data represent the average over the 1-hour test period (1-hour TWA)$^1$. Meaning the TWA started at zero, rose to the published 1-hour value, and would continue to rise if the test were continued.

There are several underlying concepts important to applying the Objective Data to any case-specific assessment:

1. More/less work performed in a given time period will increase/decrease the exposure level.
2. Larger/smaller room size will decrease/increase the exposure level.
3. Air exchange decreases exposure levels. Specifically, a 100% air-exchange every hour (either by the work moving to a discrete area, or via sufficient air movement), means Hilti’s published 1-hour TWA exposure level is expected to conservatively represent a steady-state TWA. The conceptual basis is two-fold: air exchange would inherently reduce the published “closed room” exposure value. And sufficient air exchange to “reset” the environment every hour would keep the exposure values at that level. For reference, a typical 20”, 2500 CFM box fan would introduce 100% new air volume in Hilti’s test chamber (7,200 ft$^3$), every 3 minutes$^2$.
4. The OSHA 50 μg/m$^3$ Permissible Exposure Limit (PEL), is based on an 8-hour TWA. This means the exposure level as an 8-hour TWA is ≤50 μg/m$^3$; a 4-hour TWA is ≤100 μg/m$^3$ (assuming no exposure for the remainder of the shift); a 2-hour TWA is ≤200 μg/m$^3$ (assuming no exposure for the remainder of the shift) etc. (time [hours] x exposure level [μg/m$^3$] ≤ 400).

Hilti’s published Objective Data states the amount of work performed during the 1-hour test (“1-hour work”). Therefore, the respirable silica dust exposure level in any case-specific situation is expected to be below the 8-hour TWA PEL in the following conditions$^3$:

- An employee performing ≤ “1-hour work” during a shift.
- An employee performing ≤ “1-hour work” in an hour, then moving to another discrete area and performing ≤ “1-hour work” in an hour, etc., throughout an entire shift.
- An employee performing ≤ “1-hour work” each hour, in an environment with sufficient airexchange to prevent accumulation of airborne dust.

---

1 Hilti’s published Objective Data incorporates a silica content of 20% of the total respirable dust measurement. Site-specific silica content varies. OSHA Docket No. OSHA-2010-0034, reviewed 588 respirable dust samples from construction tasks, finding the silica content varied from <1%-50%, with an average of 9.1%.
2 Note introduction/exhaust of 100% air volume does not necessarily correlate to a 100% air exchange.
3 As long as: (1) Hilti’s published Objective Data exposure level is ≤50 μg/m$^3$; (2) work is performed in a room with volume ≥ 200m$^3$, and/or having adequate ventilation; and (3) site-specific respirable silica content is ≤20% of total respirable dust.
**GRINDING**

**Grinding Dust Control — OSHA**

Hilti developed dust collection systems for its angle grinders with a shroud, to be attached to a Hilti vacuum with a filter cleaning mechanism and 99% filter efficiency, compliant with OSHA 1926.1153, Table 1.

**Set-up**

1. Attach the appropriate dust collection shroud to the grinder.
2. Select appropriately-sized vacuum (per OSHA 1926.1153 Table 1, the vacuum must have a rating of at least 25 cfm per inch of wheel diameter). Attach vacuum hose to grinder shroud.
3. Start vacuum.
4. Verify proper operation of the dust collection system, including suction at the shroud
   - Check for damage or leaks in the vacuum, hose, and shroud.
   - See instructions for vacuum.
5. Verify the shroud seal is intact, and extends to at least the face of the cup wheel.

**Grinding**

1. Start the vacuum before beginning to grind.
2. Hold the cup wheel face parallel with (flat to) the work surface. Always maintain the grinder such that the shroud seal is in full contact with the work surface (i.e., do not tilt the grinder)
3. Avoid grinding over a free edge of the work surface as much as possible.
   - shrouds can be opened slightly to allow close access to a perpendicular obstruction. Only operate in this opened condition when necessary.
4. Release the tool trigger and allow the grinder to come to a complete stop before lifting it from the work surface. Keep vacuum running until grinding operation is completed.

**Cleaning and maintenance**

- See instructions for vacuum.

Statement on features of Hilti VC 75-1-A22 series vacuum:

Regarding OSHA 29 CFR Part 1926 §1153, please note that the Hilti VC 75-1-A22 vacuum meets the following requirements given in Table 1:

- 99% or greater filter efficiency
- Manual filter mechanism
- Provides 75 cfm
- A HEPA filter is available

When used in conjunction with the corresponding Hilti tools and dust removal systems meeting the listed Table 1 requirements, the user will have a compliant system as specified in the regulation.

Please contact your local Hilti representative with any additional questions. For additional clarification, please refer to 29 CFR Part 1926 §1153.

Sincerely,

Hilti product team
June 23, 2017

Statement on features of Hilti VC 125 series vacuums:

Regarding OSHA 29 CFR Part 1926 §1153, please note that the Hilti 125-6 and 125-9 vacuums all meet the following requirements given in Table 1:

- 99% or greater filter efficiency
- Manual filter mechanism
- provide 125 cfm
- a HEPA filter is available

When used in conjunction with the corresponding Hilti tools and dust removal systems meeting the listed Table 1 requirements, you will have a compliant system as specified in the regulation.

Please contact your local Hilti representative with any additional questions. For additional clarification, please refer to 29 CFR Part 1926 §1153.

Sincerely,

Hilti product team
June 23, 2017

Statement on features of Hilti VC 20, 40, 150, and 300 series vacuums:

Regarding OSHA 29 CFR Part 1926 §1153, please note that the Hilti VC 20-U, VC 40-U, VC 40-UE, VC 150-6 X, VC 150-6 XE, VC 150-10 X, VC 150-10 XE, and VC 300-17 X vacuums all meet the following requirements given in Table 1:

- 99% or greater filter efficiency
- self-cleaning filter mechanism
- provide the below cubic feet per minute (cfm) of suction
  - VC 20-U and 40-U: 129 cfm
  - VC 150 series: 150 cfm
  - VC 300 series: 300 cfm
- a HEPA filter is available

When used in conjunction with the corresponding Hilti tools and dust removal systems meeting the listed Table 1 requirements, you will have a compliant system as specified in the regulation.

Please contact your local Hilti representative with any additional questions. For additional clarification, please refer to 29 CFR Part 1926 §1153.

Sincerely,

Hilti product team

Testing and Certification: The purpose of field testing this equipment is to assess whether it is functioning as designed in compliance with manufacturer's specifications, NSF specifications, NSF Standard #49, or other specifications which may apply. We perform all test procedures in accordance with these standards as detailed in ENV Services Protocols. Applicable copies of which are available on request. Our testing and certification apply only to the equipment and do not signify approval of the use of any hazardous agents or operational procedures.

HEPA LEAK TESTING OF HILTI HEPA VACUUM UNITS
BENCH TESTING FOR AEROSOL PENETRATION

Setup

Each Vacuum is setup with an internal prefilter bag placed in the base of the bucket and a HEPA filter placed below the motor
Airflow enters the intake and is them passed through the prefilter bag and then is siphoned up throu the HEPA filter and then discharged through nozzles on the right an left side of the vacuum housing

Procedure:
Following guidelines within Reference Standard: IES-RP-CC-0034.1
HEPA and ULPA Filter Leak Tests.
A large bag was placed over the outlet side of the Vacuum unit
The Intake airflow was measured with a Velocity meter set for CFM Calculation (135 CFM)
A calculated concentration was followed using an aerosol challenge for >10 micrograms per liter of PAC Aerosol
The Aerosol Photometer was set at a sensitivity of 50 micrograms, and the test proceeded by insertion of aerosol in the intake and sampling the outflow of the air filling the collection bag.
No leakage greater than .005% was detected

Test Setup showing Aerosol Generator on right HILTI VC20U Vacuum in middle with catch bag attached, and Aerosol Photometer on the left

[Signature]

[Date: 13Jul15]
Conclusions:
All Models passed the aerosol penetration leak test of no leakage greater than .005% penetration detected.

CALIBRATION CERTIFICATE

All calibrations are performed by qualified personnel using instrumentation, procedures and methods which guarantee specifications claimed are reliable. When specified, all calibrations are performed in accordance with current ISO/IEC 17025, ANSI/NCSL Z-540-1, MIL-STD-45662A, and ENV/Pro-Lab Quality Manual - Rev 5. Standards used are traceable to The National Institute of Standards and Technology (NIST). Expanded uncertainties are calculated using methods described in the Guide to the Expression of Uncertainty of Measurement (GUM) utilizing a coverage factor of K=2 (95% confidence) and kept on file at Pro-Lab. At a minimum, standards are selected with an uncertainty of 25% or better, where possible. This certificate and/or data shall not be reproduced except in full, without the written permission of Pro-Lab Management.

VACUUM CLEANER

VC 75 / 125 / 150 / 300 OSHA

Hilti developed a vacuum cleaner system with a filter cleaning mechanism and a >99% filter efficiency, compliant with many of the OSHA 1926.1153, Table 1 specified controls.

Set-up

1. Put a filter into the filter compartment. Decide which filter depending on your applications. See filter section for further information.
2. Put filter bag into the tank. Decide which filter bag depending on your applications. See filter bag section for further information.
3. Put hose into head and attach it to the adaptor of the tool. See tool manual for further information on correct adaptor.
4. Plug vacuum cleaner in socket.
5. Start vacuum cleaner by turning control switch on. Verify proper operation of vacuum cleaner.
   • head on correct and sealed
   • no kinks/breaks/plugs in hose
   • check for normal suction at hose end
   • nothing blocking exhaust port
   • For VC 20/40/150/300, verify the automatic filter cleaning mechanism is turned on, and operating (audible thumping every ~15 seconds).
6. Start running the tool only when vacuum cleaner is on.
7. Turn vacuum cleaner off after tool is turned off.

Cleaning and maintenance

1. For VC 75 and VC 125, push manual filter cleaning button every 3 to 5 minutes depending on application, and whenever there is a noticeable change in suction or dust collection.
2. Filter and filter bag needs to be cleaned and exchanged regularly. See filter and filter bag section for further information.
**UNIVERSAL FILTER-BAGS / PLASTIC BAGS**

**Plastic Bag**
- For dry and wet applications
- Will not increase lifetime of filter, no pre-filtering

**Universal Bag**
- For dry applications
- Virtually dustless recycling / emptying
- Pre-filter, will increase lifetime of filter

**Applications**
- For dry and wet applications
- Will not increase lifetime of filter, no pre-filtering

**How to put bag in vacuum**
1. Remove head from tank
2. Put bag into the tank
3. Check that holes are within the vacuum cleaner when installed and that the plastic bag doesn’t overlap clamp area
4. Put head back on tank and close clamps properly

**Disposal guidelines**
- Recycle bag when it is full
- Tie off or seal paper/fleece bags. Twist plastic bags. Roll bucket to nearest sealed receptacle and transfer bag to garbage.
- To be recycled normally (dispose of bag according to local regulations)

**How to put bag in vacuum**
1. Remove head from tank
2. Put bag into the tank
3. Connect flange of filter bag to the adapter
4. Put head back on tank and close clamps

**Disposal guidelines**
- Close cap when bag is full or needs to be recycled
- Dispose of bag according to local regulations.
DO’S AND DON’TS WITH UNIVERSAL FILTER-BAGS / PLASTIC BAGS

**Plastic Bag**

- **Do’s**
  - Dispose of bag when it is full

- **Don’ts**
  - Fill plastic bag to completely full, it can rip apart
  - Overlap the clamp area with the plastic bag

**Universal Bag**

- **Do’s**
  - Use filter bags for all dry applications
    - Increases lifetime of your tool
    - Increase lifetime of your filter
  - Dispose of bag when it is full
  - Mandatory for all wood applications
  - Connect flange of filter bag properly into adapter

- **Don’ts**
  - Shake full filter-bag
    - Dust can exit
    - Bag can rip apart
  - Use bag for wet applications
DO’S AND DON’TS WITH FILTERS

**Do’s**
- Maximize life of filter by utilizing the vacuum’s filter cleaning mechanism (action is optimized by sealing hose for 3-5 filter cleaning cycles) with automatic filter cleaning (close hose for a 3-5 cycles)
- Power cleaning: Remove hose, close inlet for 3-5 automatic filter cleaning cycles
- Use performance filters (PTFE) in order to have a longer lifetime of your tool, longer lifetime of the filter and less blockage of the filter
- Filter sealing needs to be properly installed
- During filter change, clean up filter frame and sealing area
- Check filter condition before starting an application

**Don’ts**
- Mix dry and wet applications. Dry filters used for wet applications needs to be exchanged with a wet/dry filter and dried before using it for dry applications
- Manually cleaning the filter can damage the filter and lead to decreased vacuum life and poor dust control capability damaged -> a damaged or missing filter can lead to a broken turbine since dust can enter (reduces lifetime of vacuum cleaner)
  - Banging against the wall
  - Cleaning with high-pressured air
  - Use water jet / air pressure jet to clean the filter
  - Use sharp things e.g. wrench etc. to clean the filter
- Use vacuum cleaner without a filter
FILTER CLEANING AND EXCHANGE

Filter needs to be cleaned when:

- Notably less suction power
  - Clean filter with automatic filter cleaning
- Dust is coming out of the vacuum cleaner. Indication that the filter is damaged or blocked.
- Visual check shows that filter needs to be cleaned

Filter needs to be exchanged when:

- Dust is coming out of the vacuum cleaner. Indication that filter is damaged or blocked.
- Even after cleaning the filter, suction power is insufficient
- Visual check shows that filter needs to be exchanged due to a high volume of dust near or inside the filter
