EVALUATION SCOPE
Compliance with the following codes:
- 2018, 2015 and 2012 International Residential Code® (IRC)

For evaluation for compliance with codes adopted by the Los Angeles Department of Building and Safety (LADBS), see ESR-4185 LABC and LARC Supplement.

Property evaluated:
Structural

USES
The Hilti S-BT Screw-in Fasteners are used to attach nonstructural components including architectural, mechanical, electrical and similar components, which are not part of the primary load-bearing or lateral-force-resisting systems, to a supporting steel substrate. The fasteners may be used for structures regulated under the IRC, when an engineered design is submitted in accordance with IRC Section R301.1.3.

DESCRIPTION
3.1 S-BT Screw-in Fasteners:
Hilti S-BT Screw-in Fasteners are self-tapping fasteners with a short, blunt threaded portion on one end for embedment into the supporting steel, and a standard thread along the majority of the shank for attachment of supported materials. A sealing washer with a chloroprene rubber (CR) sealing ring is premounted on the tapping end of the fastener. A serrated flange nut is supplied with S-BT Screw-in Fasteners for multipurpose fastenings (S-BT-M__). The S-BT Screw-in Fasteners for grating fastenings (S-BT-G__) are not supplied with serrated flange nuts and are intended for use in fastening grating.

The S-BT fasteners must be installed in a predrilled hole. See Table 1 for available fastener materials, thread designations and lengths. See Figure 1 for illustrations of the S-BT fasteners.

3.1.1 S-BT-MR and S-BT-GR Screw-in Fasteners: These fasteners are formed from stainless steel complying with the manufacturer's specification, with chemical composition of 1.4462 X2CrNiMoN22.5-3, and are zin plated to facilitate installation. The premounted sealing washer has a diameter of 0.472 inch (12 mm) and is manufactured from SAE 316 stainless steel, bonded to the CR material (denoted by 'SN' in the product designation). Serrated flange nuts for the S-BT-MR fasteners are also manufactured from stainless steel.

3.1.2 S-BT-MF and S-BT-GF Screw-in Fasteners: These fasteners are formed from Grade 1038 carbon steel and have a duplex coating. The coating consists of an electroplated zinc alloy layer and a top coat, with a total coating thickness of 35 μm. The premounted sealing washer has a diameter of 0.394 inch (10 mm) and is manufactured from an aluminum magnesium alloy, bonded to the CR material (denoted by ‘AN’ in the product designation). Serrated flange nuts for the S-BT-MF fasteners are manufactured from carbon steel with a hot-dipped galvanized coating.

3.2 Steel Substrates:
The supporting steel substrate must be structural steel complying with the minimum strength requirements of ASTM A36; ASTM A572 Grade 50 or ASTM A992, and must have the minimum thickness, yield strength and tensile strength shown in Tables 2 and 3, as applicable.

4.0 DESIGN AND INSTALLATION
4.1 Design:
4.1.1 Allowable Static Loads: The most critical applied loads, excluding seismic load effects, resulting from the load combinations in IBC Section 1605.3.1 or 1605.3.2 must not exceed the allowable loads shown in Tables 2 and 3, as applicable. For fasteners that are subjected to seismic loads, see Section 4.1.3 for additional information. The stress increases and load reductions described in IBC Section 1605.3 are not allowed.

Allowable shear loads and tension (pullout) loads in this report apply to the connection of the fastener to the supporting steel substrate only. Limit states such as pull-over and lateral bearing, which are governed by the properties of attached materials, are outside the scope of this report. Design of the connection of the attached material to the steel substrate, must take into account the properties of the attached material, accounting for interaction between the attached material, the screw-in fastener and the steel substrate, and must comply with the applicable requirements of the IBC.
4.1.2 Combined Loading: For fasteners subjected to both tension and shear loads, compliance with the following interaction equation must be verified:

\[(p/P_a) + (v/V_a) \leq 1\]

where:

- \(p\) = Actual applied tension load on fastener, lbf (N).
- \(P_a\) = Allowable tension load on fastener, lbf (N).
- \(v\) = Actual applied shear load on fastener, lbf (N).
- \(V_a\) = Allowable shear load on fastener, lbf (N).

4.1.3 Seismic Considerations: The S-BT Screw-in Fasteners are recognized for use when subjected to seismic loads as follows:

1. The fasteners may be used for attachment of non-structural components listed in Section 13.1.4 of ASCE/SEI 7, which are exempt from the requirements of ASCE/SEI 7.

2. When the fasteners listed in Table 1 are installed in steel base materials and subjected to seismic loads, the most critical load applied to each individual fastener must be determined from the equations in IBC Section 1605.3.1 or Section 1605.3.2 which include seismic load effects, and must not exceed the allowable load shown in Table 2 or 3, as applicable.

4.2 Installation:

The S-BT Screw-in Fasteners must be installed in accordance with this report and the manufacturer’s published installation instructions. A copy of these instructions must be available on the jobsite at all times during installation. The installation instructions shown in Figure 5 are abbreviated instructions and are shown for illustrative purposes only. Installation must be in accordance with the complete installation instructions which accompany the product.

Installation is limited to dry, interior locations, except for stainless steel fasteners, which may be installed in exterior or damp environments, provided the base material is protected from corrosion.

Fastener placement requires a predrilled hole. The hole must be drilled into, but not through, the steel substrate, or must be drilled all the way through the steel substrate, as indicated in Tables 2 and 3. See Figure 2 for an illustration of an S-BT fastener installed in a hole drilled into the steel and Figure 3 for an illustration of an S-BT fastener installed in a hole drilled through the steel. The hole must be drilled to the required depth with a Hilti TS-BT stepped drill bit and the Hilti SF BT or SBT 4-A22 cordless drill driver supplied by Hilti.

After the required hole is drilled, the fastener must be installed using a proper depth gauge and the Hilti SFC or SBT 4-A22 setting tool supplied by Hilti, Inc.

For S-BT-M_ fasteners, after installation of the supported material, the serrated flange nut must be screwed onto the fastener and tightened to the recommended torque (see Table 4) using a tool in accordance with Hilti, Inc. recommendations. The S-BT-M_ fasteners must be installed only with Hilti supplied serrated flange nuts.

For the S-BT-G_ fasteners, after installation of the supported grating, a grating disc or similar component must be installed, in accordance with the instructions supplied with this component.

Minimum spacing between fasteners must be 1 inch (25.4 mm) and minimum edge distance must be 1/2 inch (12.7 mm). The installed fasteners must have a stand-off dimension, \(h_{NVS}\), (defined in Figure 2), as stipulated in Table 1. Recommended spacing and edge distances apply to the fasteners installed in the steel base material. Greater spacing and edge distances may be needed due to requirements for the attached material.

5.0 CONDITIONS OF USE

The Hilti S-BT Screw-in Fasteners described in this report comply with, or are suitable alternatives to what is specified in, those codes listed in Section 1.0 of this report, subject to the following conditions:

5.1 Fasteners must be manufactured and identified in accordance with this report.

5.2 Fasteners must be installed in accordance with this report and the Hilti, Inc., published installation instructions. In the event of conflict between this report and the Hilti, Inc., published instructions, the more restrictive requirements govern.

5.3 Calculations and details demonstrating compliance with the applicable code and this report, including verifying that the applied loads are less than the allowable loads described in Section 4.1, must be submitted to the code official for approval. The calculations and details must be prepared by a registered design professional where required by the statutes of the jurisdiction in which the project is constructed.

5.4 Stainless steel fasteners may be installed in exterior, damp environments. Use of carbon steel fasteners is limited to dry, interior locations, which include exterior walls which are protected by an exterior wall envelope.

5.5 If the fastener nut or attached materials are removed and replaced, proper thread engagement for the fastener must be reconfirmed in accordance with the Hilti installation instructions.

5.6 The Hilti products addressed in this report are manufactured under a quality-control program with inspections by ICC-ES.

6.0 EVIDENCE SUBMITTED

Data in accordance with the ICC-ES Acceptance Criteria for Screw-In Fasteners Installed into Steel Elements (AC499) dated February 2018.

7.0 IDENTIFICATION

7.1 Packages of fasteners bear the product designation, the manufacturer’s name (Hilti, Inc.), and the evaluation report number (ESR-4185). The stainless steel fasteners are imprinted with an “H” on the end of the fastener, and the carbon steel fasteners are imprinted with “C” on the end of the fastener, as shown in Figure 4.

</table>

Use an SBT 4-A22, SF BT 18-A or SF BT 22-A tool. Pre-drill until the shoulder grinds a shiny ring to ensure proper drilling depth, as shown below.

The drilled hole and the area around the drilled hole must be clear of liquids and debris.

In the case of a hole through the steel, rework of the coating on the back side of the plate / profile may be needed.

Use an SBT 4-A22, SFC 18-A or SFC 22-A tool in combination with the calibrated depth gauge S-DG BT.

Verify fastener stand-off dimension, $h_{\text{NVS}}$, with check gauge S-CG BT.

Position attached item on S-BT fasteners and hold in place. Tighten the nuts with the suited tightening torque $T_{\text{rec}}$.

$T_{\text{rec}}$ ref. to table below. Tighten the nuts using:

- SBT 4-A22, SFC 18-A / 22-A with socket S-NS
- torque tool X-BT 1/4", 5.9 ft-lbf (8 Nm) or S-BT 1/4", 3.6 ft-lbf (5 Nm)
- torque wrench

Sealing washer must be properly compressed!

DIVISION: 05 00 00—METALS
Section: 05 05 23—Metal Fastenings

REPORT HOLDER:
HILTI, INC.

EVALUATION SUBJECT:
HILTI S-BT SCREW-IN FASTENERS

1.0 REPORT PURPOSE AND SCOPE

Purpose:
The purpose of this evaluation report supplement is to indicate that the Hilti S-BT Screw-in Fasteners, described in ICC-ES evaluation report ESR-4185, have also been evaluated for compliance with the codes noted below as adopted by the Los Angeles Department of Building and Safety (LADBS).

Applicable code editions:
- 2020 City of Los Angeles Building Code (LABC)
- 2020 City of Los Angeles Residential Code (LARC)

2.0 CONCLUSIONS

The Hilti S-BT Screw-in Fasteners, described in Sections 2.0 through 7.0 of the evaluation report ESR-4185, comply with the LABC Chapter 22, and the LARC, and are subject to the conditions of use described in this supplement.

3.0 CONDITIONS OF USE

The Hilti S-BT Screw-in Fasteners described in this evaluation report supplement must comply with all of the following conditions:

- All applicable sections in the evaluation report ESR-4185.
- The design, installation, conditions of use and identification of the Hilti S-BT Screw-in Fasteners are in accordance with the 2018 International Building Code® (2018 IBC) provisions noted in the evaluation report ESR-4185.
- The design, installation and inspection are in accordance with additional requirements of LABC Chapters 16 and 17, as applicable.
- Under the LARC, an engineered design in accordance with LARC Section R301.1.3 must be submitted.
- The allowable strength values listed in the evaluation report and tables are for the connection of the screw-in fasteners to steel substrate. The connection between the screw-in fasteners and the attached building material must be checked for capacity (which may govern).

This supplement expires concurrently with the evaluation report, reissued 2020.
DIVISION: 05 00 00—METALS
Section: 05 05 23—Metal Fastenings

REPORT HOLDER:

HILTI, INC.

EVALUATION SUBJECT:

HILTI S-BT SCREW-IN FASTENERS

1.0 REPORT PURPOSE AND SCOPE

Purpose:
The purpose of this evaluation report supplement is to indicate that Hilti S-BT Screw-in Fasteners, recognized in ICC-ES evaluation report ESR-4185, have also been evaluated for compliance with the codes noted below.

Applicable code editions:

◼ 2017 Florida Building Code—Building
◼ 2017 Florida Building Code—Residential

2.0 CONCLUSIONS

The Hilti S-BT Screw-in Fasteners, described in Sections 2.0 through 7.0 of the evaluation report ESR-4185, are in compliance with the Florida Building Code—Building and the Florida Building Code—Residential, provided the design and installation are in accordance with the 2015 International Building Code® provisions noted in the evaluation report.

Use of the Hilti S-BT Screw-in Fasteners has also been found to be in compliance with the High-Velocity Hurricane Zone provisions of the Florida Building Code—Building and the Florida Building Code—Residential under the following conditions.

For products falling under Florida Rule 9N-3, verification that the report holder’s quality-assurance program is audited by a quality-assurance entity approved by the Florida Building Commission for the type of inspections being conducted is the responsibility of an approved validation entity (or the code official, when the report holder does not possess an approval by the Commission).

This supplement expires concurrently with the evaluation report, reissued June 2020.
